**Summary**

- In June 2019, Pertussis remained the most common non-STD notifiable condition reported, with 28 cases. Enteric illnesses such as STEC and Salmonella were also reported more frequently, with 2 and 7 cases, respectively.
- Chlamydia and syphilis YTD case counts are elevated as compared to case counts at this time in 2018, while gonorrhea case counts have decreased by nearly 18%.
- This month’s Communicable Disease Spotlight focuses on summer travel health and can be found on page 2.

Communicable Disease

SPOTLIGHT ON Healthy Travel

The Communicable Disease Spotlight is a rotating feature which takes a closer look at public health topics of interest based on seasonality, media coverage, or impact on our community. This month, we focus on how to stay well through summer fun.

In June 2019:

50% of interviewed Salmonella, Shigella, Cryoptosproidium, and E. coli cases acquired their illness while traveling.

Tips for Summer Vacation Success

- Stick to bottled water if you don’t know the water source. This includes ice and water used for teeth brushing!
- Untreated water sources such as rivers, lakes, and ponds can be sources of illness causing bacteria. Be careful not to swallow water when playing or swimming.
- Be prepared for outdoor activities with adequate tick and mosquito protection, including protective clothing and bug spray.
- Talk to your healthcare provider about your travel plans before you go. They can provide more information about local diseases, vaccines, and preventative medications.
- Use caution when interacting with wild or unknown animals. Wash your hands with soap & water immediately after touching or petting an animal that isn’t yours.

In 2019 YTD:

46% of interviewed Salmonella, Shigella, Cryoptosproidium, and E. coli cases have been travel associated.

100% of interviewed Coccidiodomycosis and Arboviral disease cases have resulted from travel.
Summary

- Last month, a total of 28 pertussis cases were reported in Clark County, 68% of which were confirmed cases.
- 96 pertussis cases have been reported so far in 2019, a 27% increase from YTD reports through June 2018.
- June case counts were above both the expected and upper thresholds, indicating elevated pertussis activity. This is the fourth month in 2019 above the expected threshold, and the third month above the upper threshold.
Pertussis

Pertussis rate per 100,000 population, 2019 YTD
Includes confirmed, probable, and suspect cases

Pertussis cases by month with predicted and upper thresholds, 2014-2019 YTD
Includes confirmed, probable, and suspect cases
Pertussis

What is pertussis?
Also known as whooping cough, pertussis is a highly contagious respiratory illness spread through the air from an infected person when they cough, sneeze, or talk. The illness is characterized by a 
Progressively Severe Cough
which may come in fits or with additional complications such as 
Difficulty Breathing or Vomiting
Anyone of any age can get pertussis, but it may be more severe in children, especially under the age of one.

In 2018:

- 82% of pertussis cases were under the age of 20
- 43% were 2-10 years old
- 8% were ≤1 year
- 16% were 20 and over
- 35% were 11-19 years old

At time of interview, cases had been sick for 34 Days (on average)

52% of cases were male

Pertussis is a preventable condition
Effective strategies for limiting the spread of pertussis include

- Pertussis vaccination (DTaP and Tdap)
- Exclusion from school, work, and other activities while sick
- Antibiotic treatment for cases and exposed close contacts
Data Notes

- Cases included in this document were reported to Clark County Public Health (CCPH) and meet the following criteria:
  - Resident of Clark County, WA at the time of report.
  - Assigned a Washington State Department of Health case classification of confirmed, probable, or suspect.

- Conditions included herein may be reportable by law under Washington Administration Code chapter 246-101, or were obtained through voluntary submission.

- Data are provisional and subject to change.

- This report is prepared following the end of the calendar month; changes caused by delayed case reports, case deduplication, or erroneous data entries will be reflected in later reports.

- General communicable disease cases (confirmed, suspect, and probable) are counted based on notification date.

- STDs cases are counted by derived diagnosis date.

- Counts may not coincide with data in Washington State Department of Health reports due to reporting delays and minor variations in analysis.

- Select case classifications are excluded for Measles, Rubella, Diphtheria, Poliomyelitis, Lyme Disease, and Mumps.

- Conditions with zero case counts at all presented data points are excluded from this report.

- For the most comprehensive HIV surveillance data, as well as information on HIV outreach and prevention, visit the Washington State Department of Health HIV Statistics and Research page: https://www.doh.wa.gov/DataandStatisticalReports/DiseasesandChronicConditions/HIVAIDSData

- Local-level Hepatitis B and C data is currently under review. For more information about Hepatitis in Washington state, visit the Washington State Department of Health Chronic Hepatitis Surveillance Page: https://www.doh.wa.gov/DataandStatisticalReports/DiseasesandChronicConditions/ChronicHepatitisSurveillance
