**Summary**

Multnomah County Public Health is investigating a confirmed case of measles whose symptom onset was June 22, 2018. Approximately 500 contacts in the Portland metro area, including several in Clark County, are being notified of their exposure. All contacts are being advised to watch for signs and symptoms of measles and seek health care for diagnosis by calling ahead in order to avoid exposing others in waiting rooms and lobbies.

**Clinical presentation**

Please consider measles in patients who:
- Present with febrile rash illness and the “three Cs”: cough, coryza (runny nose) or conjunctivitis (pink eye).
- Recently traveled internationally or were exposed to someone who recently traveled.
- Have not been vaccinated against measles.

Health care providers should also consider measles when evaluating patients for febrile rash illnesses, including dengue [https://www.cdc.gov/dengue/](https://www.cdc.gov/dengue/) and Kawasaki disease [https://www.cdc.gov/kawasaki/](https://www.cdc.gov/kawasaki/).

If you suspect measles, refer to the steps on the attached Suspect Measles Worksheet.

For persons who plan to travel internationally, health care providers should encourage timely vaccination of all persons aged ≥6 months who lack evidence of measles immunity.* One dose of MMR vaccine is recommended for infants aged 6-11 months traveling internationally, and 2 doses for persons aged ≥12 months, with a minimum interval of 28 days between doses.

Routine MMR vaccination is recommended for all children, with the first dose given at age 12–15 months and a second dose at age 4–6 years. Unless they have other evidence of immunity,* adults born after 1956 should get at least one dose of MMR vaccine, and two appropriately spaced doses of MMR vaccine are recommended for health care personnel, college students and international travelers.

Measles was documented as “eliminated” in the United States in 2000. However, importation of measles cases and limited local transmission continue to occur.

---

*Presumptive evidence of measles immunity is defined as:*

1. *Birth before 1957 (but see §6.2 of the Oregon Investigative Guidelines)*
2. *Laboratory-confirmed disease*
3. *Laboratory evidence of immunity (protective antibody titers) or*
4. *Documentation of age-appropriate vaccination with a live measles virus-containing vaccine:*
   - Pre-school children: 1 dose
   - Children in grades K–12: 2 doses
   - Women of childbearing age: 1 dose
   - Health care personnel born during or after 1957: 2 doses
   - Students at post-high-school educational institutions: 2 doses
   - International travelers ≥12 months of age: 2 doses
   - Children 6–11 months of age who plan to travel internationally: 1 dose
   - All other adults: 1 dose.
### Suspect Measles Worksheet

**Probable and confirmed cases are IMMEDIATELY reportable to Clark County Public Health**

<table>

<td></td>
<td></td>
<td>Contact CCPH for potential exposure sites.</td>
</tr>
</tbody>
</table>

Measles is highly suspected if you answered YES to at least one item in B and C, PLUS YES in D or E or F.

**IMMEDIATELY:**
- Mask and isolate the patient (in negative air pressure room when possible) AND
- Call Clark County Public Health at the numbers below to arrange testing at the WA State Public Health Laboratories (WAPHL). All health care providers must receive approval prior to specimen submission.

Collect the following specimens:
- **Nasopharyngeal (NP) swab for rubeola PCR and culture (the preferred respiratory specimen)**
  - Swab the posterior nasal passage with a Dacron™ or rayon swab and place the swab in 2–3 ml of viral transport medium. Store specimen in refrigerator and transport on ice.
  - Throat swab also acceptable.
- **Urine for rubeola PCR and culture:**
  - Collect at least 50 ml of clean voided urine in a sterile container (sputum specimen containers also work very well for transporting urine.) and store in refrigerator.
- **Serum for rubeola IgM and IgG testing:**
  - Draw blood in a red or tiger top (serum separator) tube. The ideal amount of blood is 4-5 ml, 1 ml being the minimum in order to yield enough serum to perform testing.
  - Let specimen sit at room temperature for 1-4 hours to clot; then spin down to separate serum.
  - Pipette serum into a new red top tube. Can send a tiger top tube as is.
  - Store serum specimen in refrigerator until it can be transported on ice.

If you have questions about this assessment or the collection and transport of specimens, please call Clark County Public Health Communicable Disease Unit at:

**Monday - Friday (8am-5pm):** (360) 397-8182

**After hours (CCPH duty officer):** (888) 727-6230
